Week 2 Reset Sprint:

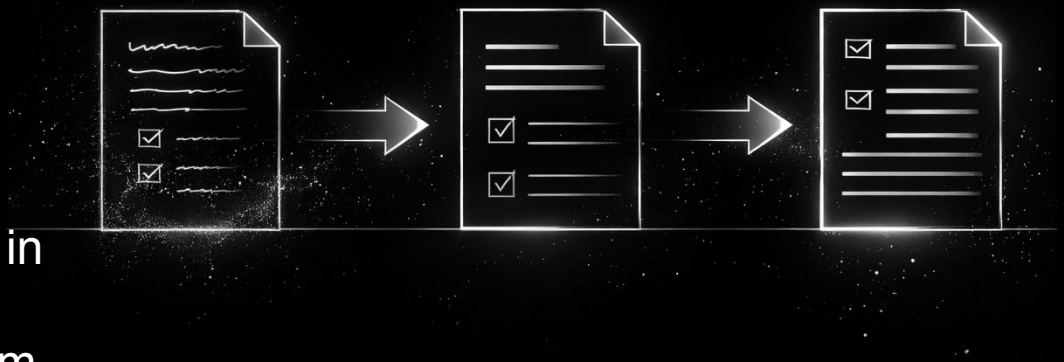
GitHub, Scope, and Getting Unstuck

Why this week looks different

- Administrative issues slowed Week 1
- Many teams are not fully set up yet
- We fix that **in class**
- We are rebuilding the workflow, not lowering the standard

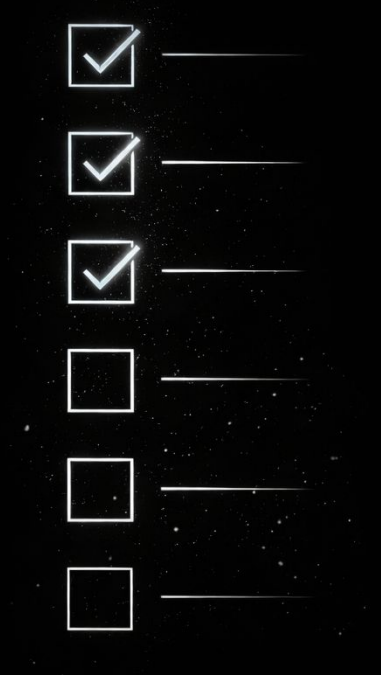
Week 1 work: required, not graded

- Week 1 submissions are still required
- They are not graded
- They are expected to be works in progress
- You will revise and improve them during the semester



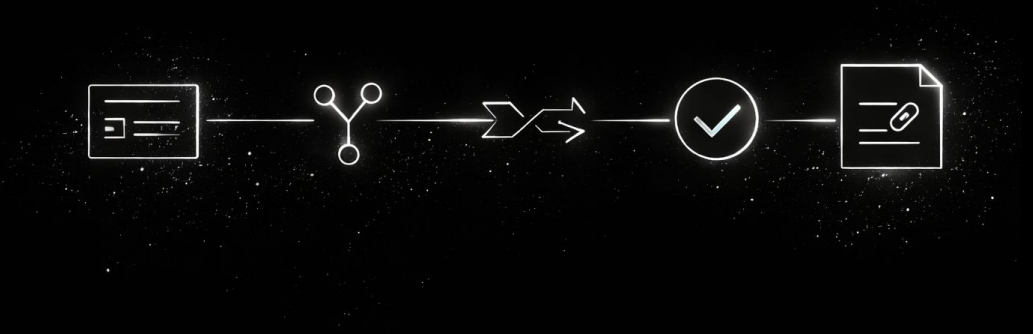
What success looks like today

- GitHub access working
- Team members in the correct group/repo
- A team agreement started or updated
- A project idea written in the template
- PROJECT.md updated
- A Sprint Packet started
- One tiny technical proof



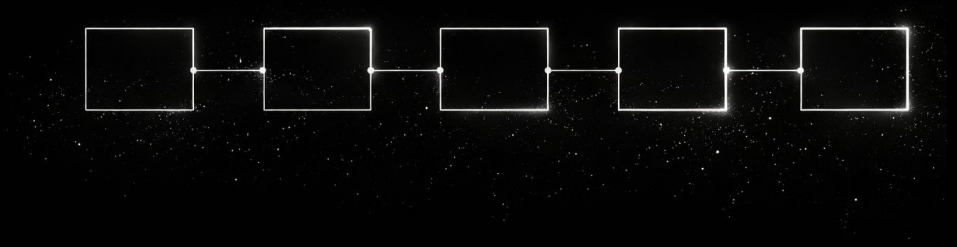
GitHub is where the class happens

- Tasks live in Issues
- Work happens on branches
- Changes are reviewed in PRs
- Progress is visible on the Project board
- Weekly proof goes in the Sprint Packet
- If it isn’t linked, it didn’t happen



The workflow (seriously, just this)

1. Issue = task
2. Branch = where you work
3. Commit = save progress
4. PR = propose the change + show evidence
5. Merge = done in main



What we are setting up in class

1. join the correct GitHub repo/group
2. confirm access
3. open Issues
4. open the Project board
5. open Pull Requests
6. identify this week’s role owners

How your board should work

Columns:

- To Do
- Doing
- Done

Rules:

- every card has one owner
- every card has a Definition of Done
- blocked work gets labeled and explained

A PR is not just "I changed stuff"

A good PR answers:

- What changed?
- Why?
- How tested?
- Evidence?

Minimum standard:

- links to an Issue
- includes "How tested"
- passes checks, if set up

These are the four things you are building

- Project Idea Pitch Issue
- Team Agreement
- PROJECT.md
- Weekly Sprint Packet

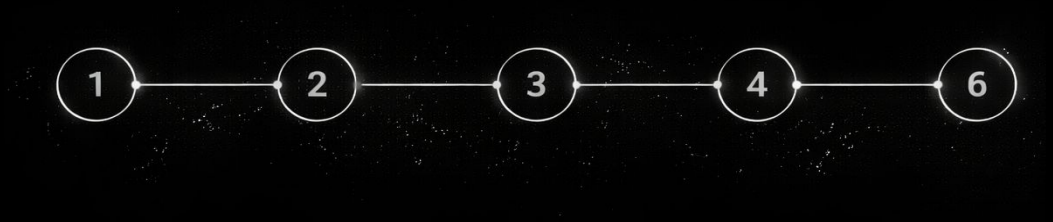
Your idea is not your whole fantasy

Your Week 4 target should be:

- small
- demoable
- end-to-end
- reliable

Ask:

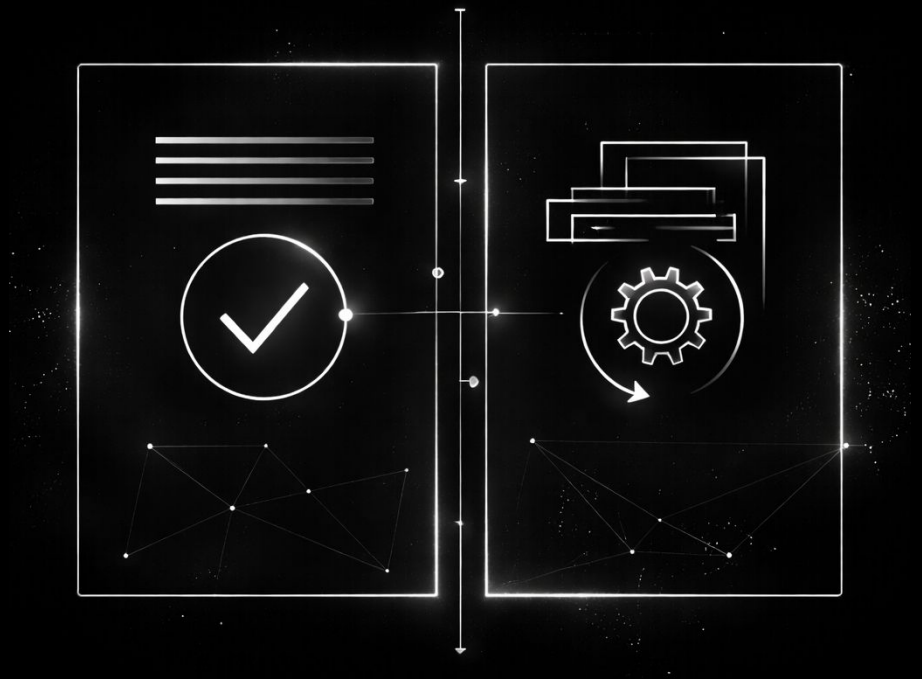
- Who is the user?
- What pain are we solving?
- What is the smallest version we can demo?
- What are we explicitly not building?



If your demo breaks, start here

PROJECT.md must stay updated with:

- product in one sentence
- demo flow
- backup plan
- how to run
- how to test



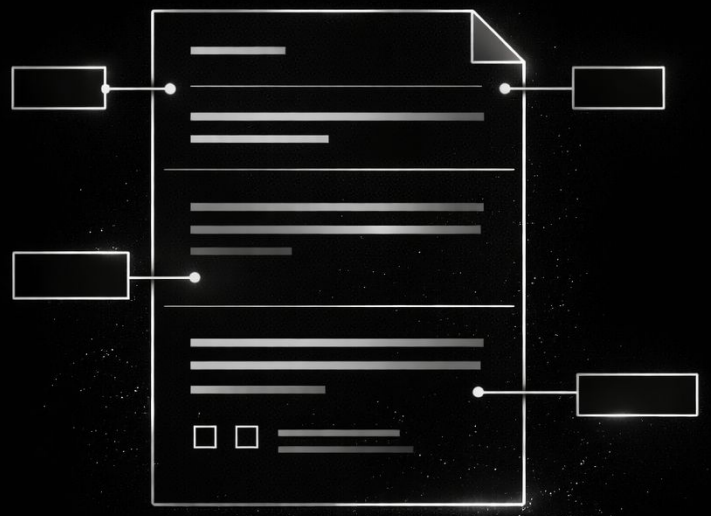
Team Agreement: boring, clear, useful

- team identity
- communication rules
- weekly roles
- definition of done
- conflict process
- freeloading process
- sign-off

What your weekly submission must show

Every Sprint Packet includes:

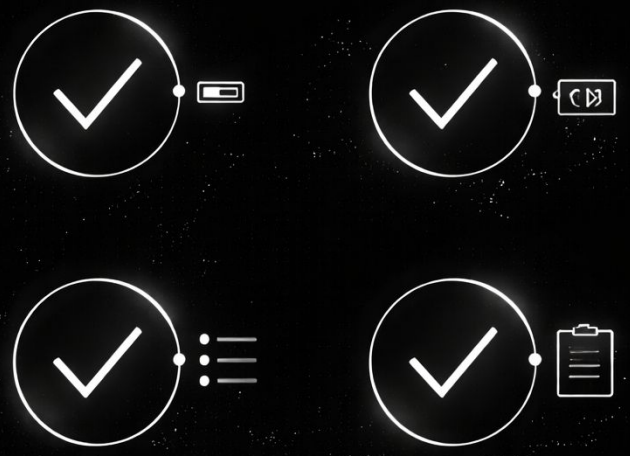
- demo link
- demo script
- backup plan
- board snapshot
- shipped work with links
- blockers
- next sprint plan
- individual receipts in comments



Today you must build one real thing

Examples:

- app runs locally
- first screen exists
- one endpoint works
- database connects
- one end-to-end click path works
- one prototype flow is clickable



What changes, what does not

What stays the same:

- midterm/final anchors
- GitHub-first workflow
- evidence rules
- weekly submission system

What changes:

- early weeks get compressed
- Week 4 demo should be smaller
- scope control gets stricter earlier

What we are doing today

1. Fix GitHub access
2. Join the correct team/repo
3. Learn the Issue → Branch → PR workflow
4. Update the four core documents
5. Build one tiny technical proof
6. Show your links before you leave

What you must show before class ends

Your team should be able to show:

- repo link
- Project Idea Pitch Issue
- Team Agreement
- updated PROJECT.md
- Sprint Packet started
- one live proof or visible technical result

Evidence beats explanation

- show the link
- show the board
- show the PR
- show how you tested it
- show the demo or backup
